## 1.0 EXECUTIVE SUMMARY

A total of 128 brook trout were collected within the vicinity of stations sampled from 7 October 2011 through 9 October 2011 as part of the fall 2011 tissue survey (Table 4-1). Of the fish collected, 25 brook trout, including 13 males and 12 females, were selected for metals analyses from Stations 1, 3, 4, 6, 8, 9, and 10.

Among all brook trout collected during the fall survey, lengths ranged from 50 millimeters (2.0 inches) to 308 millimeters (12.1 inches), and average length was 137 millimeters (5.4 inches;  $s = 1.9$  inches;  $n = 126$ ). These length statistics also include brook trout collected from locations that were adjacent to the stations (upstream or downstream of stations) that are typically surveyed during annual summer aquatic surveys. AEM selected brook trout that ranged from 139 millimeters (5.5 inches) to 229 millimeters (9.0 inches) in length for conducting metals analyses. Scale sample analyses indicated that 24 brook trout were at least one to two years old, with one brook trout of least three years old (Table 4-3).

Among all 25 brook trout that were selected for metals analyses, copper concentrations within fillets ranged from 0.35 mg/kg to 0.84 mg/kg ( $\bar{x} = 0.57$  mg/kg;  $s = 0.12$  mg/kg), and from 1.4 mg/kg to 40.3 mg/kg ( $\bar{x} = 10.6$  mg/kg;  $s = 8.8$  mg/kg) in livers (Tables 4-7 through 4-10). Nickel concentrations ranged from less than 0.015 mg/kg to 0.17 mg/kg ( $\bar{x} = 0.044$  mg/kg;  $s = 0.033$  mg/kg) in fillets, and ranged from less than 0.017 mg/kg to 0.12 mg/kg ( $\bar{x} = 0.040$  mg/kg;  $s = 0.026$  mg/kg) in livers. Mercury levels in fillets ranged from 0.023 mg/kg to 0.320 mg/kg ( $\bar{x} = 0.105$  mg/kg;  $s = 0.073$  mg/kg).

## 2.0 INTRODUCTION

This memo provides a summary of metals content data in brook trout (*Salvelinus fontinalis*) collected from streams in the vicinity of the Eagle Project as part of the fall 2011 fish tissue metals survey. Brook trout collections for metals analyses were conducted by Advanced Ecological Management, LLC (AEM) in accordance with the MDEQ Nonferrous Metallic Mineral Mining Permit Number: MP O1 2007, following the GLEAS *Procedure #31 Fish Collection and Processing Procedure* (MDEQ, 1997). Information from this survey is intended to provide an additional year of baseline data regarding metals concentrations within brook trout that were collected from the project vicinity.

### **3.0 METHODS**

The 2011 brook trout metals survey was conducted in locations that were sampled in the summer of 2011 using the P-51 survey protocol (Figure 1-1, Exhibit A). These sample stations are situated in the same sample locations, or close to the sample locations that were surveyed by AEM during the 2008 fall brook trout tissue survey and during the 2011 annual aquatic survey.

#### **3.1 Fish Collection**

Survey stations were blocked at upstream and downstream extents using seines that measured 4 feet by 50 feet, with a 0.19-inch mesh size. A backpack electroshocker was used in narrow (approximately ≤10 feet), or difficult-to-access stations (e.g., areas with abundant woody debris). A barge-mounted electroshocker was used to sample stations that were deep (approximately 2 to 3 feet), wide (approximately >10 feet), and where woody debris was sparse enough to permit the passage of the barge unit. Three consecutive passes were conducted, each in an upstream direction. The duration of electroshocking was recorded for each pass and stunned fish were placed in a live-well for identification and enumeration. Following the third pass and subsequent fish identification, fish were released within the station.

As part of the enumeration process, the number of each species present was recorded. One representative of each species that was not identifiable in the field was placed in a voucher jar containing 10% formalin for later identification. Each voucher jar was labeled according to the sample location and date. Fish were identified to species using various taxonomic references (Bailey et al., 2003; Coon, 2001; Becker, 1983).

#### **3.2 Stream Habitat Conditions**

Habitat conditions, water quality, and stream dimensions were documented during the aquatic survey. Photographs were taken at each station to illustrate conditions during the sampling period (Exhibit C). Water temperature, dissolved oxygen, pH, and conductivity were measured as part of the stream habitat evaluation. These water quality parameters were measured using a Yellow Springs Instrument Professional Plus water quality meter.

Wetted stream width was measured at the lower, middle, and upper extent of each sample station. Depth was measured in the center, and at 20% and 80% of each stream width cross section. Stream flow was measured with a Marsh-McBirney Flo-Mate 2000®.

### **3.3 Fish Tissue Analyses**

Consistent with the methodology described in the 8 August 2011 Eagle Brook Trout Metals Analyses Plan that was submitted to the MDEQ, AEM followed the GLEAS, Procedure 31 protocol to collect and handle brook trout (AEM, 2011). A total of ten stream stations were surveyed by AEM fisheries personnel as part of the fall survey using a backpack electro-shocker, or a barge electro-shocking unit (Figure 1-1, Exhibit A). Brook trout were collected for metals analyses during the fall aquatic survey within, or in the nearby vicinity of established stream stations. All collected fish were placed immediately in water-filled tubs to keep collected fish alive. Tub contained portable battery-operated aerators, and were placed in the stream shocking unit or along the stream banks.

Upon completion of the fish survey within each station, and in accordance with the 2011 Eagle Brook Trout Metals Analyses Plan, the number of brook trout was recorded. Based on sample size, a determination was made to keep approximately 20% of the brook trout collected from the sample station, or release all if five or fewer brook trout were collected. For several sites where more than five brook trout greater than two inches in length were collected, AEM sampled beyond the typical station length in an attempt to provide additional data for metals analyses. Additional sampling beyond the established station length was conducted once the survey of the station area was complete.

#### **3.3.1 Tissue Processing**

The processing area and all processing materials (e.g., knives, table, and balance tray) were rinsed with de-ionized water prior to fish processing. Photographs of each fish labeled with date, length, weight, and sample location information were collected (Exhibit B). Working from the smallest specimen to the largest specimen, each fish was weighed, measured, and sex was determined as they were processed. Scale samples were taken and placed in aging sample envelopes labeled with date, body of water, station number, personnel, sample identification number, fish length, and fish weight.

Fillet tissue samples were processed according to guidance provided in Attachment 10 of GLEAS Procedure 31. The edible portion samples (left and right fillets) were wrapped in aluminum foil with dull side to fillet. Aluminum foil packages for each fish were placed in a separate clear plastic bag and labeled with the following information: date, water

body, station number, species, fillet weights, and sample identification number. Liver samples from each fish were wrapped in aluminum foil with dull side to liver and placed in a separate clear plastic bag. Each liver package was labeled with the following information: date, water body, station number, species, liver weight, and sample identification number. Fillet and liver packages for each fish were placed in specimen packages and labeled with the following information: date, water body, station number, species, sample identification number, fish length, and fish weight.

All bags from a given sample station were placed in a large plastic bag and labeled with station number and water body. All bags were placed on ice and samples were frozen daily until all ten sample stations were surveyed. Chain of Custody forms provided by the laboratory were completed where processing was conducted. All samples were placed in a cooler provided by the laboratory, along with completed Chain of Custody forms and ice, and sent to Pace Analytical Services, Inc via next-day courier service following the completion of surveying all ten stations.

Fillets and livers were processed by Pace Analytical Services, Inc. using the Inductively Coupled Plasma-Mass-Spectrometry Method 6020. Fillets were processed for the following metals: aluminum, antimony, arsenic, barium, beryllium, boron, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, silver, strontium, and zinc. Livers were processed for divalent metals, including cadmium, copper, lead, nickel, silver, and zinc.

Average metals contents presented in Table 4-7 and Table 4-8 were calculated based on laboratory results provided by Pace Analytical Services, Inc. Reported Minimum Detectable Limit (MDL) varied according to the amount of tissue that was available for analyses. Typically, larger tissue amounts allowed for a lower detectable limit (T. Noltemeyer, Pace Analytical Services, personal communication, February 15, 2012). MDL values were used in the calculation of average statistics for samples that were recorded as non-detect in Table 4-7 and Table 4-8.

#### **4.0 RESULTS**

A total of 128 brook trout were collected within the vicinity of stations sampled from 7 October 2011 through 9 October 2011 as part of the fall 2011 tissue survey (Table 4-1). Of the fish collected, 25 brook trout, including 13 males and 12 females, were selected

for metals analyses from Stations 1, 3, 4, 6, 8, 9, and 10. Sample station locations are described in Table 4-2 (Exhibit B).

Among all brook trout collected during the fall survey, lengths ranged from 50 millimeters (2.0 inches) to 308 millimeters (12.1 inches), and average length was 137 millimeters (5.4 inches; standard deviation -  $s = 1.9$  inches; sample size -  $n = 126$ ). These length statistics also include brook trout collected from locations that were adjacent to the stations (upstream or downstream of stations) that are typically surveyed. AEM selected brook trout that ranged from 139 millimeters (5.5 inches) to 229 millimeters (9.0 inches) in length for conducting metals analyses. Scale sample analyses indicated that 24 brook trout were at least one to two years old, with one brook trout at least three years old (Table 4-3). Photographs of individually labeled brook trout collected for metals analyses are presented in Exhibit D.

#### **4.1 Stream Habitat Conditions**

Sample station locations during the 2011 fall fish tissue metals survey were consistent with locations surveyed during the 2011 summer aquatic survey conducted by AEM.

Average sample station depth ranged from 0.3 feet in Station 3 to 2.3 feet in Station 6 during the October survey, and discharge ranged from 224 gallons per minute in Station 10 to 7,102 gallons per minute in Station 5 (Table 4-4). The water levels of Station 6 and Station 7 were influenced by nearby beaver dams and were the only sample stations that had water elevations at bank-full levels during the October survey.

Average water temperature ranged from 12.2°C in Station 3 to 16.3°C in Station 6, and varied little among measurements within each station (Table 4-5). Dissolved oxygen levels were the lowest in Station 6 and Station 7 among all sample stations. The average pH ranged from 6.7 in Station 7 to 8.1 in Station 9, and conductivity was low among all sample stations (Table 4-5).

#### **4.2 Metals Concentration in Tissues**

Copper, mercury, and nickel concentrations are summarized within the text of this report, and all other metals data are summarized within Tables 4-7 through 4-10. Chain of Custody forms are presented in Exhibit E.

#### 4.2.1 Salmon Trout River:

##### Station 1

A total of 16 brook trout were collected from Station 1 and the nearby vicinity (Table 4-1). An additional 100 feet of stream upstream of Station 1 and an additional 250 feet downstream of Station 1 were sampled to increase the sample size for metals analyses. A total of three brook trout, including two males that were at least two years old and one female that was at least one year old were selected from Station 1 for metals analyses (Table 4-3). Brook trout selected for metals analyses from Station 1 ranged in length from 180 millimeters (7.0 inches) to 192 millimeters (7.6 inches;  $\bar{x} = 184$  millimeters;  $s = 6.9$  millimeters), and ranged in weight from 54.1 grams (1.9 ounces) to 67.3 grams (2.4 ounces;  $\bar{x} = 60.8$  grams;  $s = 6.6$  grams).

Copper concentrations of brook trout fillets ranged from 0.52 mg/kg to 0.71 mg/kg ( $\bar{x} = 0.62$  mg/kg,  $s = 0.10$  mg/kg), and from 2.3 mg/kg to 13.2 mg/kg ( $\bar{x} = 8.0$  mg/kg,  $s = 5.47$  mg/kg) in livers (Tables 4-7 through 4-10). Nickel concentrations of brook trout fillets ranged from 0.026 mg/kg to 0.037 mg/kg ( $\bar{x} = 0.030$  mg/kg,  $s = 0.006$  mg/kg). Two of the three liver samples were non-detectable for nickel and one was 0.021 mg/kg. Mercury levels were only measured in brook trout fillets and ranged from 0.035 mg/kg to 0.046 mg/kg ( $\bar{x} = 0.042$  mg/kg;  $s = 0.006$  mg/kg). See Tables 4-7 through 4-10 for additional data on metals contents observed in brook trout collected from Station 1 and adjacent reaches.

##### Stations 2 and 3

No brook trout were collected from Station 2 or upstream of the station during the October 2011 survey. A total of six northern redbelly dace (*Phoxinus eos*) were collected from Station 2 (Table 4-6).

A total of 15 brook trout were collected in the vicinity of Station 3 (Table 4-1). To increase the sample size for metals analyses, an additional 300 feet of stream was sampled immediately downstream of Station 3. A total of three brook trout, including one male and two females were selected for metals analyses from Station 3. Brook trout selected for metals analyses from Stations 2 and 3 ranged in length from 187 millimeters (7.4 inches) to 229 millimeters (9.0 inches;  $\bar{x} = 208$  millimeters;  $s = 21.0$  millimeters), and ranged in weight from 69.9 grams (2.5 ounces) to 124.6 grams (4.4 ounces;  $\bar{x} = 94.7$  grams;  $s = 21.0$  grams).

89.9 grams;  $s = 30.2$  grams). All brook trout collected for metals analyses from Station 3 were at least one year old (Table 4-3).

Copper concentrations from brook trout collected within Station 3 ranged from 0.42 mg/kg to 0.84 mg/kg ( $\bar{x} = 0.63$  mg/kg;  $s = 0.21$  mg/kg) in fillets and from 3.9 mg/kg to 16.6 mg/kg ( $\bar{x} = 9.5$  mg/kg;  $s = 6.5$  mg/kg) in brook trout livers (Tables 4-7 through 4-10). Nickel concentrations ranged from 0.029 mg/kg to 0.067 mg/kg ( $\bar{x} = 0.044$  mg/kg;  $s = 0.020$  mg/kg) in brook trout fillets and ranged from 0.02 mg/kg to 0.04 mg/kg ( $\bar{x} = 0.027$  mg/kg;  $s = 0.011$  mg/kg) in brook trout livers. Mercury levels in brook trout fillets ranged from 0.17 mg/kg to 0.32 mg/kg ( $\bar{x} = 0.24$  mg/kg;  $s = 0.08$  mg/kg). See Tables 4-7 through 4-10 for additional data on metals contents observed in brook trout collected from Station 3.

### **Station 6**

A total of 6 brook trout were collected in the vicinity of Station 6 (Table 4-1). To increase the sample size for metals analyses, an additional 150 feet of stream was sampled immediately downstream of Station 6, and an additional 200 feet was sampled upstream of the station. One male brook trout that was at least two years old was selected for metals analyses from Station 6 (Table 4-3). The brook trout was 139 millimeters (5.5 inches) in length and weighed 20.3 grams (0.7 ounces).

Copper concentrations from the Station 6 brook trout in fillets tissue was 0.57 mg/kg and in liver tissue was 7.1 (Tables 4-7 through 4-10). Nickel concentration was 0.029 mg/kg in fillets tissue and was less than 0.12 mg/kg liver tissue. Mercury levels in brook trout fillets were 0.250 mg/kg.

### **Station 7**

No brook trout were collected in Station 7 (Table 4-1). Because of low brook trout abundance and high water from beaver activity, additional stream in the vicinity of Station 7 was not sampled. The fish community within Station 7 was comprised of northern redbelly dace and brook sticklebacks (*Culaea inconstans*) during the October 2011 survey (Table 4-6).

#### 4.2.2 Salmon Trout River East Branch

##### Station 8

A total of 20 brook trout were collected from the vicinity of Station 8 (Table 4-1). Four female brook trout all at least one year old were selected for metals analyses (Table 4-3). One brook trout that was selected for metals analyses was collected within Station 8 and the other three brook trout were collected from a 100-foot long reach located immediately upstream of Station 8. Brook trout selected for metals analyses ranged in length from 171 millimeters (6.7 inches) to 198 millimeters (7.8 inches;  $\bar{x} = 180$  millimeters;  $s = 12$  millimeters), and ranged in weight from 51.6 grams (1.8 ounces) to 82.4 grams (2.9 ounces;  $\bar{x} = 62.0$  grams;  $s = 13.9$  grams).

Copper concentrations from brook trout collected within the vicinity of Station 9 ranged from 0.40 mg/kg to 0.61 mg/kg ( $\bar{x} = 0.54$  mg/kg;  $s = 0.097$  mg/kg) in fillets and from 1.4 mg/kg to 5.1 mg/kg ( $\bar{x} = 2.6$  mg/kg;  $s = 1.7$  mg/kg) in livers (Tables 4-7 through 4-10). Nickel concentrations ranged from 0.038 mg/kg to 0.070 mg/kg ( $\bar{x} = 0.051$  mg/kg;  $s = 0.014$  mg/kg) in fillets. Two of the four liver samples were non-detectable for nickel concentrations, one sample was 0.22 mg/kg, and the other liver sample was 0.28 mg/kg. Mercury levels in fillets ranged from 0.095 mg/kg to 0.160 mg/kg ( $\bar{x} = 0.119$  mg/kg;  $s = 0.030$  mg/kg). See Tables 4-7 through 4-10 for additional data on metals contents observed in brook trout collected in the vicinity of Station 8.

##### Station 9

A total of 20 brook trout were collected from the vicinity of Station 9 (Table 4-1). To increase the sample size for metals analyses, an additional 350 feet of stream was sampled immediately downstream of Station 9. Four brook trout, including three males and one female, were selected for metals analyses within the vicinity of Station 9. Brook trout selected for metals analyses ranged in length from 141 millimeters (5.6 inches) to 205 millimeters (8.1 inches;  $\bar{x} = 182.5$  millimeters;  $s = 28.5$  millimeters), and ranged in weight from 26.7 grams (0.9 ounces) to 89.1 grams (3.1 ounces;  $\bar{x} = 68.2$  grams;  $s = 28.9$  grams). Two brook trout selected for metals analyses were at least one year old and two brook trout were at least two years old (Table 4-3).

Copper concentrations from brook trout collected within the vicinity of Station 9 ranged from 0.53 mg/kg to 0.62 mg/kg ( $\bar{x} = 0.58$  mg/kg;  $s = 0.04$  mg/kg) in fillets and from 2.5

mg/kg to 19.5 mg/kg ( $\bar{x} = 13.2$  mg/kg;  $s = 7.5$  mg/kg) in livers (Tables 4-7 through 4-10). Two of the four fillet samples were non-detectable for nickel, one sample was 0.025 mg/kg, and the other sample was 0.100 mg/kg. One of the liver samples was recorded as non-detect for nickel. The remaining four livers ranged from 0.025 mg/kg to 0.046 mg/kg ( $\bar{x} = 0.033$  mg/kg;  $s = 0.011$  mg/kg). Mercury levels in fillets ranged from 0.023 mg/kg to 0.130 mg/kg ( $\bar{x} = 0.098$  mg/kg;  $s = 0.051$  mg/kg). See Tables 4-7 through 4-10 for additional data on metals contents observed in brook trout collected in the vicinity of Station 9.

### **Station 10**

A total of 21 brook trout were collected from the vicinity of Station 10 (Table 4-1). An additional 100 feet of stream was surveyed downstream of Station 10 and an additional 75 feet upstream of station 10 was surveyed to increase sample size for metals analyses. Two male and two female brook trout were selected for metals analyses from fish collected within the vicinity of Station 10. Brook trout selected for metals analyses ranged in length from 166 millimeters (6.5 inches) to 211 millimeters (8.3 inches;  $\bar{x} = 180.3$  millimeters;  $s = 20.8$  millimeters), and ranged in weight from 52.6 grams (1.9 ounces) to 118.7 grams (4.2 ounces;  $\bar{x} = 69.5$  grams;  $s = 32.8$  grams). Three brook trout were at least two years old and one was at least three years old (Table 4-3).

Copper concentrations from brook trout collected in Station 10 ranged from 0.46 mg/kg to 0.79 mg/kg in fillets ( $\bar{x} = 0.58$  mg/kg;  $s = 0.15$  mg/kg) and from 5.3 mg/kg to 24.8 mg/kg ( $\bar{x} = 14.2$  mg/kg;  $s = 9.1$  mg/kg) in brook trout livers (Tables 3-7 through 3-10). Nickel concentrations ranged from less than 0.017 mg/kg to 0.170 mg/kg ( $\bar{x} = 0.070$  mg/kg;  $s = 0.068$  mg/kg) in brook trout fillets. Two of the four liver samples were non-detectable for nickel concentrations, one sample was 0.44 mg/kg, and the other liver sample was 0.57 mg/kg. Mercury levels in fillets ranged from 0.040 mg/kg to 0.063 mg/kg ( $\bar{x} = 0.052$  mg/kg;  $s = 0.009$  mg/kg). See Tables 4-7 through 4-10 for additional data on metals contents observed in brook trout collected in the vicinity of Station 10.

### **4.2.3 Cedar Creek**

### **Station 4**

A total of 30 brook trout were collected from Cedar Creek and six were selected for metals analyses (Table 4-1). Four of the brook trout were males and two were females. Brook trout ranged in length from 144 millimeters (5.7 inches) to 215 millimeters (8.5

inches;  $\bar{x}$  = 185.5 millimeters;  $s$  = 31.3 millimeters) and ranged in weight from 27.5 grams (1.0 ounces) to 89.6 grams (3.2 ounces;  $\bar{x}$  = 62.7 grams;  $s$  = 27.8 grams). Four of the brook trout collected for metals analyses from Station 4 were at least two years old and two were at least one year old (Table 4-3).

Copper concentrations from brook trout collected within the vicinity of Station 4 ranged from 0.35 mg/kg to 0.83 mg/kg ( $\bar{x}$  = 0.53 mg/kg;  $s$  = 0.16 mg/kg) in fillets and from 6.2 mg/kg to 40.3 mg/kg ( $\bar{x}$  = 14.2 mg/kg;  $s$  = 13.0 mg/kg) in livers (Tables 4-7 through 4-10). Nickel concentrations ranged from less than 0.015 mg/kg to 0.070 mg/kg ( $\bar{x}$  = 0.036 mg/kg;  $s$  = 0.020 mg/kg) in fillets. Two of the six liver samples were non-detectable for nickel and the remaining four ranged from 0.034 mg/kg to 0.100 mg/kg ( $\bar{x}$  = 0.052 mg/kg;  $s$  = 0.032 mg/kg). Mercury levels in fillets ranged from 0.059 mg/kg to 0.091 mg/kg ( $\bar{x}$  = 0.074 mg/kg;  $s$  = 0.013 mg/kg) in Station 4. See Tables 4-7 through 4-10 for additional data on metals data observed in brook trout collected from Stations 4.

#### **4.2.4 Yellow Dog River**

##### **Station 5**

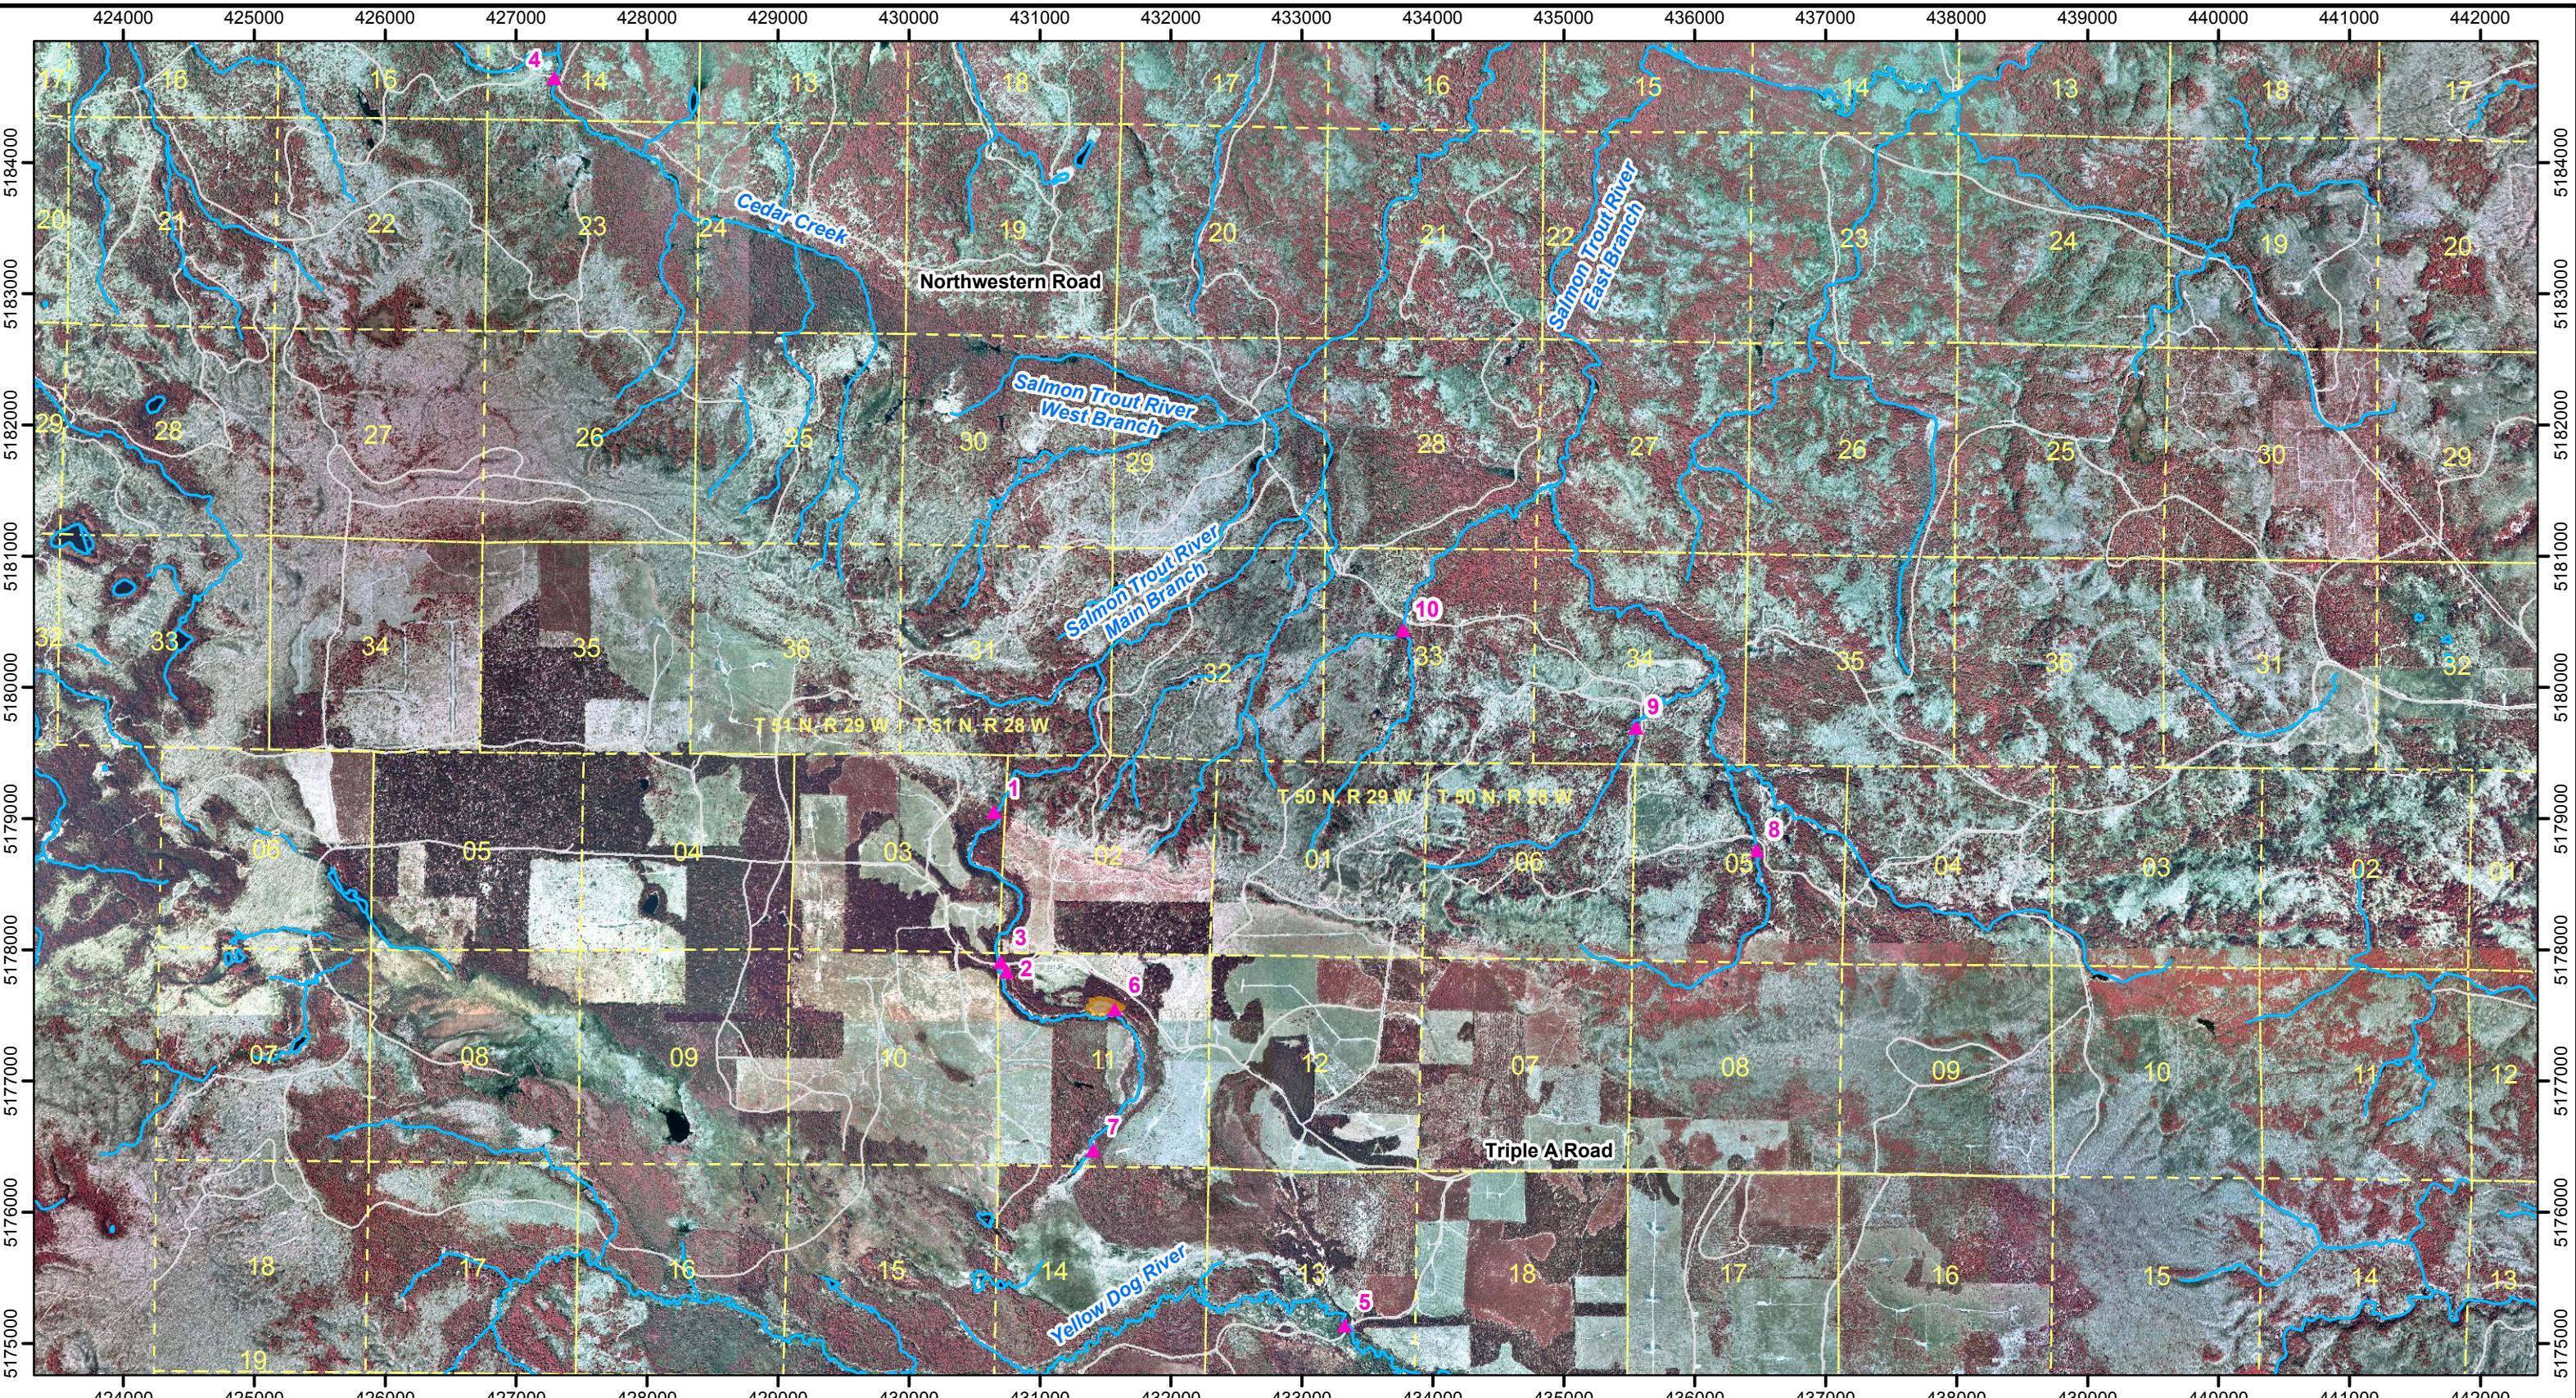

No brook trout were collected from Station 5 during the October 2011 survey. The fish community within Station 5 was predominantly comprised of blacknose dace (*Rhinichthys obtusus*) and creek chubs (*Semotilus atromaculatus*) at the time of the fall metals survey (Table 4-6).
